Elevated heliport. A heliport located on a raised structure on land.

Ellipsoid height (Geodetic height). The height related to the reference ellipsoid, measured along the ellipsoidal outer normal through the point in question.

Final approach and take-off area (FATO). A defined area over which the final phase of the approach manoeuvre to hover or landing is completed and from which the take-off manoeuvre is commenced. Where the FATO is to be used by helicopters operated in performance class 1, the defined area includes the rejected take-off area available.

Geodetic datum. A minimum set of parameters required to define location and orientation of the local reference system with respect to the global reference system/frame.

Geoid. The equipotential surface in the gravity field of the Earth which coincides with the undisturbed mean sea level (MSL) extended continuously through the continents.

Note.— The geoid is irregular in shape because of local gravitational disturbances (wind tides, salinity, current, etc.) and the direction of gravity is perpendicular to the geoid at every point.

Geoid undulation. The distance of the geoid above (positive) or below (negative) the mathematical reference ellipsoid.

Note.— In respect to the World Geodetic System — 1984 (WGS-84) defined ellipsoid, the difference between the WGS-84 ellipsoidal height and orthometric height represents WGS-84 geoid undulation.

Gregorian calendar. Calendar in general use; first introduced in 1582 to define a year that more closely approximates the

Heliport. An aerodrome or a defined area on a structure intended to be used wholly or in part for the arrival, departure and surface movement of helicopters.

Integrity (aeronautical data). A degree of assurance that an aeronautical data and its value has not been lost nor altered since the data origination or authorized amendment.

Obstacle. All fixed (whether temporary or permanent) and mobile objects, or parts thereof, that:

a) are located on an area intended for the surface movement of aircraft; or

b) extend above a defined surface intended to protect aircraft in flight; or

□□□□□□□□□□□□□□□□□□□□□□□□□□□□

reduced TLOF (Figure I-3-2 refers). The FATO is bound by the outer circle from which the obstacle sector surfaces derive their origin. The TLOF is bound by the inner circle (represented as a circle within the octagon shape of the helideck load-bearing area). The FATO outside the TLOF perimeter represents a non-load bearing surface for helicopters as it usually extends over the safety device (whether safety net or safety shelf) which is incapable of supporting even the static load of a helicopter. Therefore, a helideck incorporates one FATO and one TLOF; notwithstanding for a fixed or floating offshore facility, to improve operational flexibility, there may be the possibility to provide additional helideck(s) elsewhere on the facility – the advantages of this are raised in Chapter 3, 3.2.1.10.

3.3.3 It should be remembered that the basic size of a 1 D FATO with coincident TLOF is, of necessity, a compromise for offshore operations where space is invariably limited. Nonetheless, it is essential that the TLOF provides sufficient space for the landing gear configuration and sufficient surface area to promote a helpful “ground cushion” effect from rotor downwash. The area provided should also allow adequate room for passengers and crew to alight or embark the helicopter and to transit to and from the operating area safely. In addition, space consideration needs to be given to allow essential on deck operations, such as baggage handling, tying down the helicopter or helicopter refuelling, to occur safely and efficiently, and, in the event of an incident or accident occurring, for rescue and firefighting teams to always have good access to the landing area from an upwind location (see also Chapter 6).

3.3.4 The design should allow for sufficient clearance from the main rotor and tail rotor of the helicopter to essential objects permitted to be around the perimeter of the TLOF, including obstacles that may be present in the limited obstacle sector (LOS). It should be clearly understood that a FATO of 1 D is the minimum dimension sufficient for the containment of the helicopter; in this case, where a precise landing is completed (see also Chapter 5, especially the use of touchdown/positioning marking circle), the main and tail rotors will abut the edge of the 1 D circle. For this reason it is important that the yellow touchdown/positioning marking circle is accurately and clearly marked and is used by aircrew every time for positioning the helicopter during the touchdown manoeuvre.

3.3.5 Sufficient margins to allow for touchdown/positioning inaccuracies as a result of normal variations or handling difficulties, for example due to challenging meteorological conditions, aerodynamic effects and/or dynamic motions due to ocean waves, should be allowed for in the design. The helideck and environs should provide adequate visual cues and references for aircrew to use throughout the approach to touchdown manoeuvre, from initial helideck location and identification (acquisition) through final approach to hover and to landing. In addition, adequate visual references should be available for the lift-off and hover into forward flight.

3.3.6 In consequence of the considerations stated above, except where an aeronautical study/risk assessment is

PTS VPT-DSN.D.455 Obstacle-free volume (OFV)

(a) The obstacle-free volume, as depicted in Figure D-15, is created by extending vertically upward the outside edges of the SA up to height h_1. The edges at height h_1 are then extended upwards linearly up to height h_2 to provide a funnel-shaped volume. At height h_2, 0.5 D are added on each side of the VTOL procedure volume so that the dimensions of the obstacle-free volume at height h_2 are:

(1) the length (TO_{back}+0.5 D) behind the aircraft and the length (TO_{front}+0.5 D) in front of the VTOL-capable aircraft, referenced to the aircraft centre of the smallest enclosing circle when positioned on the FATO; and

(2) the width (TO_{width}+1 D).

(b) The obstacle-free volume should not be penetrated by obstacles.

Note: A larger SA may be warranted for specific local conditions, e.g. severe aerology.

CASA AC139.V-01 EASA

```
FPA = FATO Protection Area
VPS = Vertical Procedure Surface
OFV = FPA VPS
```

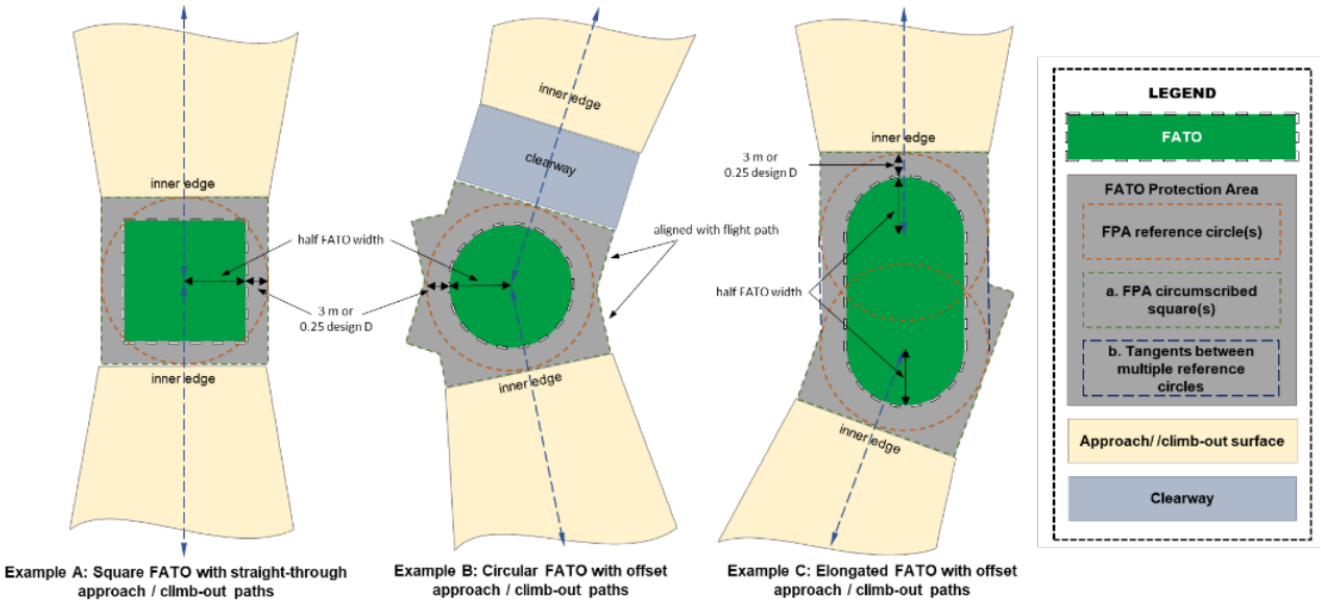

Figure 7 - Protection surfaces for vertiports without vertical procedures

4.2.3 Vertical Procedure Surface

4.2.3.1 A vertical procedure surface (VPS) should be established for where vertical procedures are used for landing or take-off from the vertiport.

4.2.3.2 The VPS is a surface that encompasses the area bordered by a circumscribed square(s) aligned with the intended aircraft flight path(s) centred on the VPS reference circle, as shown in Figures 8, 9 and 11.

4.2.3.3 A VPS should be free of obstacles.

4.2.3.4 A VPS reference circle should be established above and centred on the FATO.

4.2.3.5 The diameter of a VPS reference circle should be the diameter of the associated FPA reference circle, plus 1 Design D per 100 ft increase in height above the FATO.

4.2.3.6 The vertiport operator should determine the elevation of the VPS subject to the performance characteristics of the most demanding VCA intended to use the vertiport or the VCA operator's intended operational requirements.

4.2.4 Obstacle Free Volume (OFV)

4.2.4.1 An OFV should be established between a VPS and the associated FPA.

4.2.4.2 An OFV should be free of obstacles.

4.2.4.3 The OFV is a truncated cone extending between the edge of the FPA reference circle to the edge of the VPS reference circle, as shown in Figure 8, 9 and 11.

[illegible] h0 [illegible] OFV[illegible] OFV [illegible]

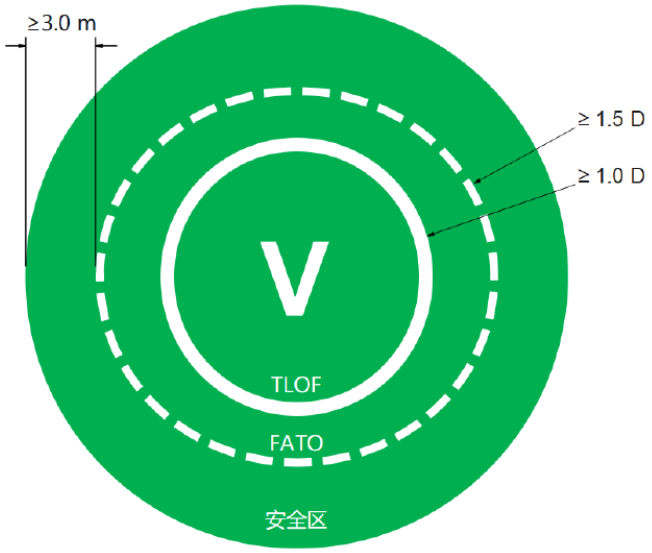

图 5.4-1 FATO、TLOF 和安全区场地物理特性示意图

5.5 机位

5.5.1 机位的尺寸和形状应满足 eVTOL 起降场设计机型在停放时，eVTOL 的垂直投影均包含在机位中。

5.5.2 机位形状为圆形，其尺寸应至少能够内切一个设计机型 1.2D的圆，机位与机位之间的间距应至少为 2.0 m。

5.5.3 机位上宜设置满足 eVTOL 停放所需的系留设施。

5.6 地面滑行道

5.6.1 在机位与机位之间、机位与机库之间应设置地面滑行道。

5.6.2 地面滑行道应能承受 eVTOL 移动时的运行荷载。

5.6.3 地面滑行通道的宽度应不小于 eVTOL 起落架宽度或 eVTOL 转运装置最大轮外侧间距的 2 倍。

6 障碍物限制

6.1 净空条件良好时

6.1.1 在空域环境良好时，eVTOL 起降场障碍物限制面宜参照 MH 5013《民用直升机场飞行场地技术标准》中的规定，并以 eVTOL 最大全尺寸 D代替直升机最大旋翼直径。进近和起飞爬升面内边宽度为 FATO 加安全区的宽度，内边位置为安全区边界。

6.1.2 eVTOL 起降场宜至少设置两个进近/起飞爬升面，中线夹角宜不小于 135° 。

6.2 净空条件复杂时

6.2.1 当场址周边净空条件复杂，或参照 MH 5013《民用直升机场飞行场地技术标准》设置障碍物限制面无法满足净空要求时，宜考虑设置悬停高度（以 h_0表示）及相应的无障碍空间（OFV）。进近和起飞爬升面、过渡面起始端位于无障碍空间顶面，其他参数宜参照 MH 5013《民用直升机场飞行场地技术标准》设置。

6.2.2 悬停高度的设置应根据周边航路上的障碍物及 eVTOL 的飞行性能确定。

示例：以正方形 FATO 为例，悬停高度 h0≤D 时的障碍限制面示意图见图 6.2-1，悬停高度 h0＞D 时的障碍限制面示意图见图 6.2-2。
